

Ex

main() {

[for(int i=0 ; i<a ; i++)
 [for(int i=0 ; i<b ; i++)
 [cout << i]
]
]
for(int i=0 ; i<c ; i++)
 cout << i²

y

operations:- (a * b) + c

T.C = O((a * b) + c)

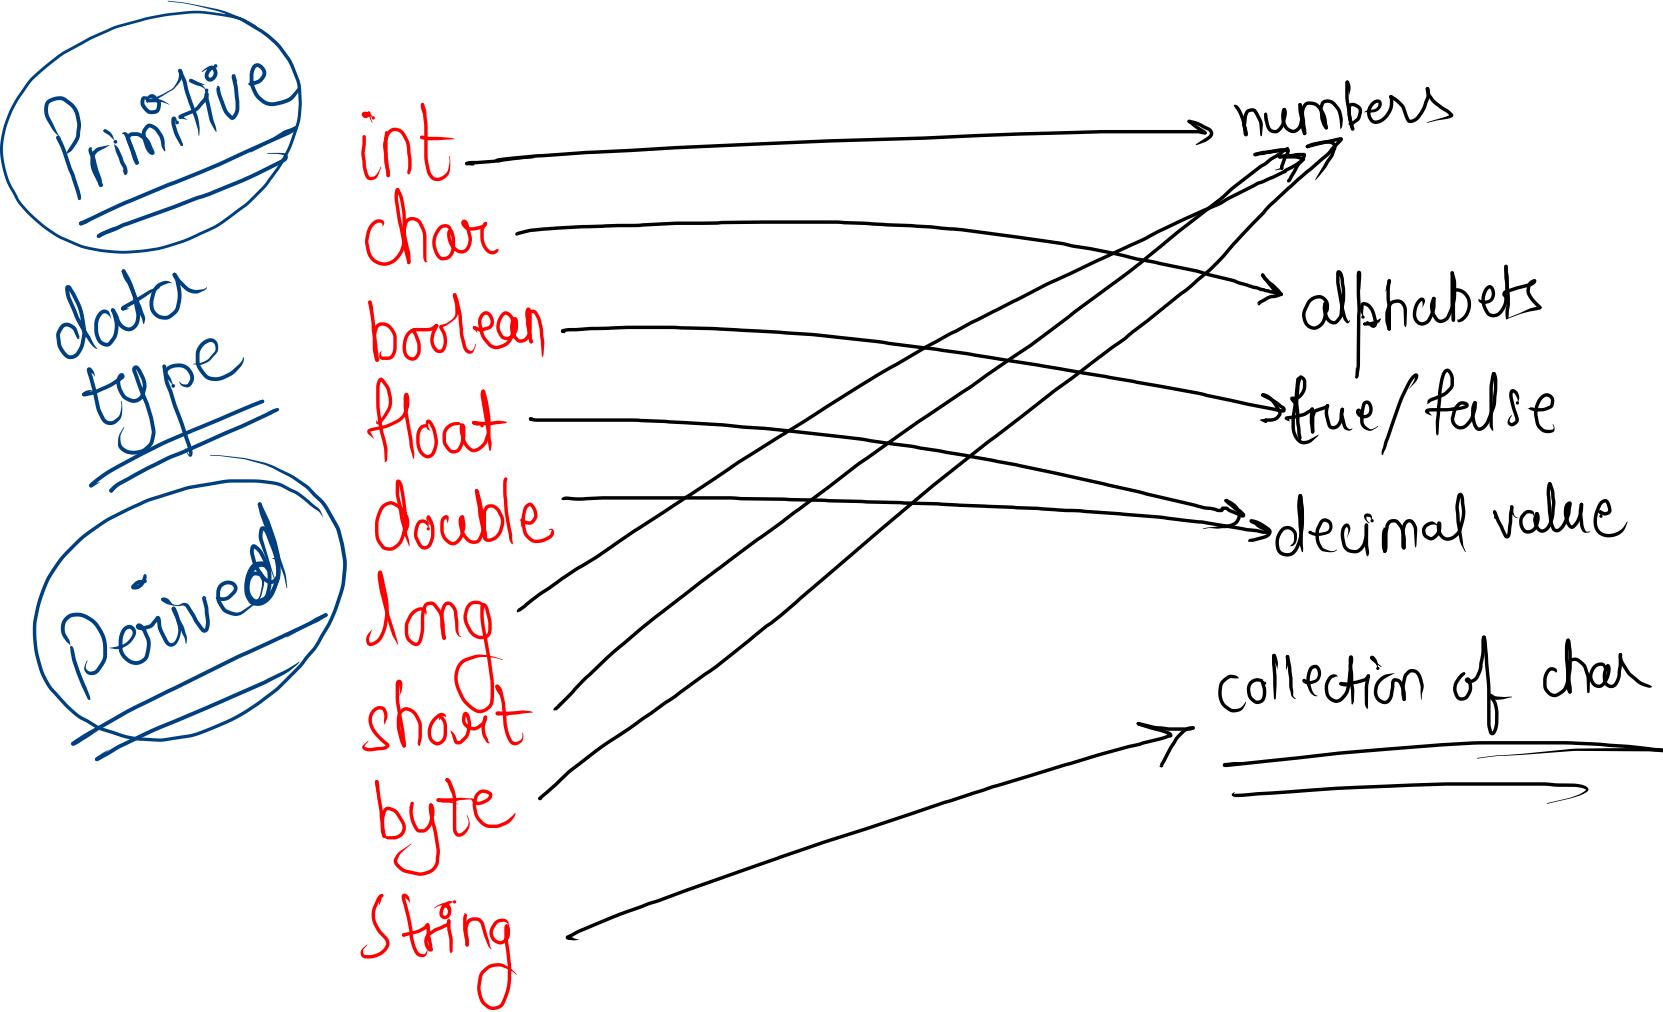

Revision

- Programming Language & Operators
- Variables
- Condition and logical operators
- ★ → if else condition (ladder)
- nested if else
- Switch case
- ★★ → Characters and Strings (typecasting & ascii value)
- ★ → for loops
- while and do while loop
- ★ → Patterns (Template)
- Functions (return statement)
- ★ → Digit Traversal & Number theory ($/10$, $\%10$)
- ★★★ → Arrays (Printing, updating, searching, upgradation)
- ★ → Brute force approach (Permutation & Combination)
- ★ → Time Complexity & Space complexity

⇒ Operators (special symbols used to perform operations)

- arithmetic :- + , - , * , / , %
- Logical operation :- && , || , !
- Relational operation :- > , < , >= , <= , == , !=
- Assignment operation :- = (right to left)
- Unary operator :- a++ , a-- , ++a , --a
- Ternary operator :- (relation) ? true : false ;

⇒ variables

⇒ Conditions

1) if (condition) {
 // statement
}

2) if (cond) {
 }
 else {
 }
 }

Notes :-

- 1) always a single statement can be executed
- 2) always check from top to bottom
- 3) if cond" is mandatory & all others are optional
- 4) we can check 1 or more condition in one statement

Jadders

if (cond1 && cond2) {

s1

 } else if (cond3) {

s2

 } else if (cond4) {

if else

ladder

y
:
:
!

else {

 statement

y

nested if else

```
if ( _____ ) {  
    [ if( _____ ) {  
        [ if( _____ ) {  
            [ } else {  
                [ }  
    } else {  
        [ if( _____ ) {  
            [ } else if( _____ ) {  
                [ } else {  
                    [ }  
    }  
}
```

Nested

Syntax switch statement

```
switch ( condition ) {
```

```
    Case val1 :
```

```
        // statement 1
```

```
        break ;
```

```
    Case val2 :
```

```
        // statement 2
```

```
        break ;
```

```
    Case val3 :
```

```
        // st 3
```

```
        break ;
```

```
    default :
```

```
        // st 4
```

```
        break ;
```

```
}
```

never compulsory

⇒ How to manipulate no. of decimal digits

```
public class Main {  
    public static void main(String[] args) {  
        int a = 15;  
        int b = 5;  
        double ans = a / b;  
        System.out.println( String.format("%.5f", ans) );  
    }  
}
```

⇒ Characters & String

String str = "Geekster classes";
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

Inbuilt functions

- str.length() → 16
- str.charAt(index) → 'C'
- str.toUpperCase() → "GEEKSTER_CLASSES"
- str.toLowerCase() → "geekster classes"
- concatenation :- str + str

str1 = "abc"

str2 = "efg"

str1 + str2 = "abc efg"

str2 + str1 = "efgabc"

str1 + 25 = "abc25" → charAt(4) ⇒ 5

for loops

```
for (initialisation ; conditions ; upgradation){  
    // statement  
}
```

initialisation :- from where to start

condition :- when to stop

upgradation :- how to move

while loop

```
initialisation  
while ( conditions ) {  
    // Statement  
    upgradation  
}
```

Note :- both can be used to solve any question

~~jmp~~

ascii values

char ch = 'd'

$$\begin{aligned} \text{int index} &= \text{ch} - \text{'a'} \\ &= \text{'d'} - \text{'a'} \\ &= 100 - 97 \\ &= 3 \\ &= \end{aligned}$$

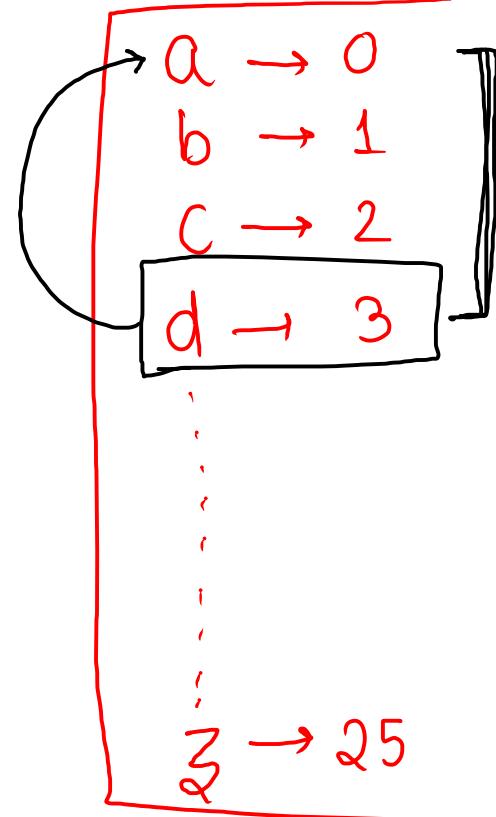

ascii value

a	→ 97
b	→ 98
c	→ 99
d	→ 100
e	→ 101

⋮
⋮
⋮
⋮
⋮

3 → 122

indexing

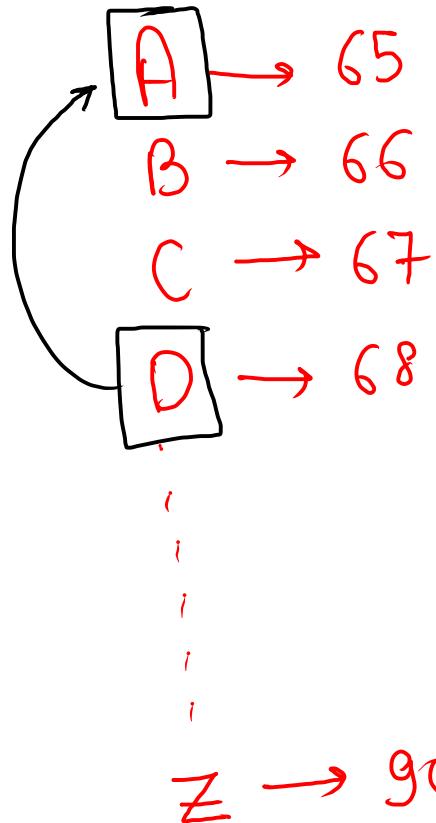

char ch = 'D'

$$\text{int idx} = \text{ch} - \text{'A'}$$

$$= \text{'D'} - \text{'A'}$$

$$= 68 - 65$$

$$= 3$$

char ch = '4'

$$\text{int idx} = \text{ch} - '0'$$

$$= '4' - '0'$$

$$= 15 - 11$$

int idx = 4

assuming

'Q' → 11

'1' → 12

'2' → 13

'3' → 14

'4' → 15
