

Type Casting :- converting one data type
into another

Implicit :- which converts automatically

Ex:-

int val = 'd' + 1 ;

val = 101

Explicit :- which we have to perform
forcefully

Ex:-

char val = 'd' + 1 ;

char val = (char) 101 ;

char val = 'e'

Ques Input will be a character type of digit from 0 to 9 , which we have to convert to int

char ch = '2' ; ↗

int ans = 2

$$\boxed{\text{ans} = \text{ch} - '0'}$$

$$= '2' - '0'$$

$$= 2$$

assuming

'0'	→ 12
'1'	→ 13
'2'	→ 14
'3'	→ 15
'4'	→ 16
'5'	→ 17
'6'	→ 18
'7'	→ 19
'8'	→ 20
'9'	→ 21

Print character at 3rd index

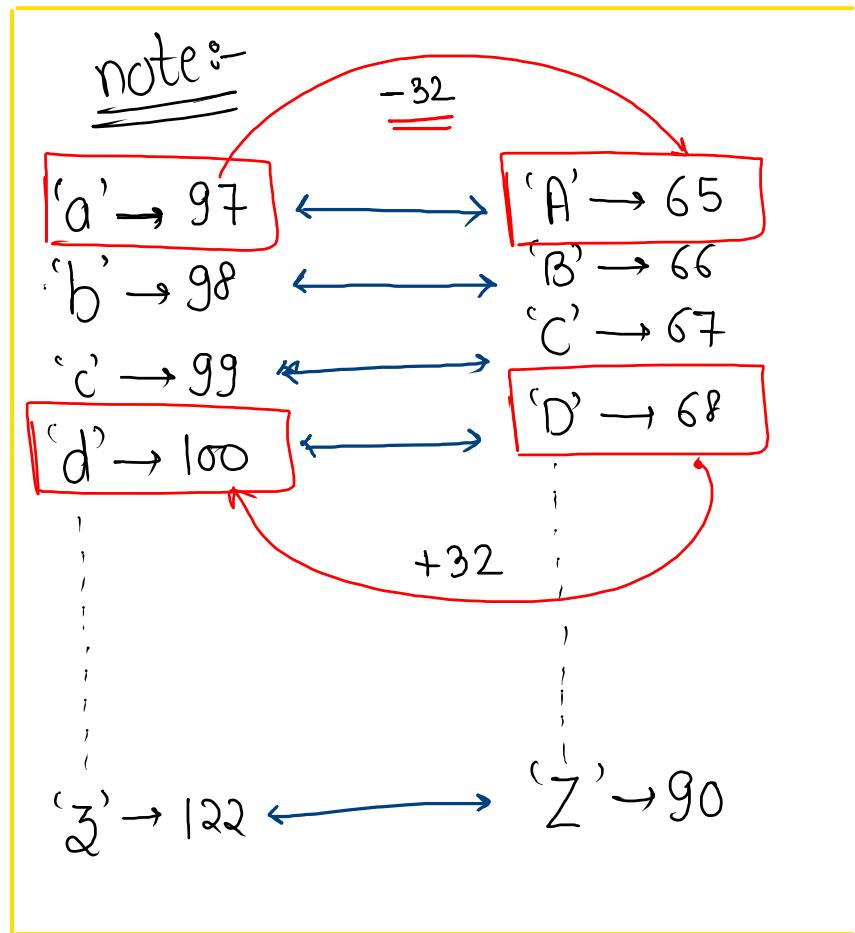

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    String str = scn.nextLine();  
  
    if ( str.length() >= 4 ) {  
        System.out.println( str.charAt(3) );  
    } else {  
        System.out.println("Small string");  
    }  
}
```

Toggle the character

ch = 'a' → 'A'

pseudo code (Blueprint of actual code)

- 1) take input a char
- 2) check if ch is lower case
 - 2.1) convert to upper case
- 3) check if ch is upper case
 - 3.1) convert to lower case

Code

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    char ch = scn.next().charAt(0);  
  
    if ( ch >= 'a' && ch <= 'z' ) {  
        char ans = (char)(ch - 32);  
        System.out.println(ans);  
    } else {  
        char ans = (char)(ch + 32);  
        System.out.println(ans);  
    }  
}
```

⇒ Concatenation (+)

String str1 = "abc";

String str2 = "ABC";

String ans1 = str1 + str2; // "abcABC"

String ans2 = str2 + str1; // "ABCabc"

String ans3 = str1 + "XYZ" + str2; // "abcXYZABC"

String ans4 = str1 + '5'; // "abc5"
 0 1 2 3 4

String ans5 = str1 + " " + str2; // "abc ABC"
 0 1 2 3 4 5 6

Concatenate_Two_Strings

str1 = " abc _ ABC "

str2 = " efg "

str1 + str2 = "abc ABCefg"

code

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    String str1 = scn.nextLine();  
    String str2 = scn.nextLine();  
  
    String ans = str1 + str2;  
    System.out.println(ans);  
}
```

string concatenate 2

str1 = "abc" ; // 3

str2 = "ef" ; // 2

pseudo code

- 1) take 2 strings as input (str1 & str2)
- 2) find length of both strings (len1 & len2)
- 3) compare len for bigger and smaller string
- 4) len1 > len2
 - 4.1) print (str2 + str1 + str2)
- 5) len2 > len
 - 5.1) print (str1 + str2 + str1)

Code

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    String str1 = scn.nextLine();  
    String str2 = scn.nextLine();  
  
    int len1 = str1.length();  
    int len2 = str2.length();  
  
    if (len1 > len2) {  
        String ans = str2 + str1 + str2;  
        System.out.println(ans);  
    } else if ( len1 < len2 ) {  
        String ans = str1 + str2 + str1;  
        System.out.println(ans);  
    }  
}
```

\Rightarrow Loops (M. Imp)

↳ used to execute a piece of code multiple times

Types of loop :-

- ↖ → for loop ☆
- ↖ → while loop
- ↖ → do while loop
- ↖ → for each loop

→ for loop

Syntax:-

```
for ( initialization ; condition ; upgradation ) {  
    //statement  
}
```

Initialization :- from where to start

Condition :- when to stop

Upgradation :- by how much to move

(Note:- all 3 are optional)

Ex:-

```
for ( int i = 0 ; i < 10 ; i++ ) {  
    Sys0(i);  
}
```

$i = 0, (0 < 10)$

$i = 1, (1 < 10)$

$i = 2, (2 < 10)$

Print 2,9,16...

$n = 30$, series = 2, 9, 16, 23, 30, 37, 44, ...

Ex:-

```
for (int i=2 ; i <= n ; i += 7) {  
    cout(i);  
}
```

One liner :- from 2 to n by +7

Code

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    int n = scn.nextInt();  
  
    for (int i = 2; i <= n; i += 7) {  
        System.out.println(i);  
    }  
}
```

Print 3 7 11 15...

$n = 30$, series :- 3, 7, 11, 15, 19, 23, 27

Code

```
[ for( int i=3 ; i < n ; i+=4 ) {  
    Sys0(i);  
}
```

Note:- from 3 to $(n-1)$ by +4

Print n to 1

```
public static void main(String[] args) {  
    Scanner scn = new Scanner(System.in);  
    int n = scn.nextInt();  
  
    for (int i = n; i >= 1; i--) {  
        System.out.println(i);  
    }  
}
```

Note:- from n to 1 by -1

Print n to 0

Note:-

from n to 0 by -1

```
[for( int i=n ; i>=0 ; i-- ) {  
    Sys0(i);  
}
```
